The Nutrition Care Process

Health Status and Nutritional Status

- Nutrition is important to promote health and prevent and treat disease statuses.
- Adequacy of nutrient intake is important but does not completely describe nutritional status.
- Determination of a person’s nutritional status is also dependant on a wide variety of factors (biological, pathological, behavioral, cognitive, and environmental and systems).
Table 2.3 Critical Thinking Used in the Nutrition Care Process

**Nutrition Assessment**
- Observe for nonverbal and verbal cues to prompt effective interviewing methods.
- Determine appropriate data to collect.
- Select assessment tools and procedures.
- Apply assessment tools in valid and reliable ways.
- Distinguish relevant from irrelevant data.
- Distinguish important from unimportant data.
- Validate the data.
- Organize and categorize the data in a meaningful framework that relates to nutrition problems.
- Determine when a problem requires consultation with or referral to another provider.

**Nutrition Diagnosis**
- Find patterns and relationships among the data and possible causes.
- Make inferences (“If this continues to occur, then this is likely to happen”).
- State the problem clearly and singularly.
- Suspend judgment (be objective and factual).
- Make interdisciplinary connections.
- Rule in/rule out specific diagnoses.
- Prioritize the relative importance of problems.

**Nutrition Intervention**
- Set and prioritize goals.
- Define the nutrition prescription or basic plan.
- Make interdisciplinary connections.
- Initiate behavioral and other interventions.
- Match intervention strategies with client needs, diagnoses, and values.
- Choose from among alternatives to determine a course of action.
- Specify the time and frequency of care.

**Nutrition Monitoring and Evaluation**
- Select appropriate indicators/measures.
- Use appropriate reference standards for comparison.
- Define where patient/client is now in terms of expected outcomes.
- Explain variance from expected outcomes.
- Determine factors that help or hinder progress.
- Decide between discharge or continuation of nutrition care.
ADA’s Standardized Nutrition Care Process

- The four steps of the nutrition care process are:
  - Nutrition assessment
  - Nutrition Diagnosis
  - Nutrition Intervention
  - Nutrition Monitoring and Evaluating

- By using the nutrition care process, dietetics practitioners can demonstrate that nutrition care improves outcomes because it:
  - Is a systematic method used to make decisions to provide safe and effective care
  - Provides a common language for documenting and communicating the impact of nutrition care
  - Relies on an evidence based approach
  - Uses specific critical thinking skills for each step
Nutrition Care Process and Model

- Nutrition care is provided within the context of a larger model that includes a central core focused on individual care and positive relationships
- Both external (environmental) and internal (resources of dietetic practitioner) factors influenced the type of nutrition care provided
- Two other systems, the screening and the referral system and the outcomes management systems support the steps of the nutrition care process. Dietetics practitioner participates in both of these systems, but may not have sole responsibility for accomplishing the tasks they perform.

Nutrition Care Process Step 1 – Nutrition Assessment

- Nutrition care assessment should ensure that appropriate and reliable data that are collected for use in determining the existence of specific nutrition problems
- Organizing and categorizing data utilizing the five domains of the assessment standardized terms improves the efficiency and effectiveness of nutrition assessment and nutrition diagnosis

Nutrition Care Process Step 2 – Nutrition Diagnosis

- Nutrition diagnosis is not the same a medical diagnosis. It describes a problem for which nutrition related activities provide the primary intervention.
- The desired format for writing a nutrition diagnosis is PES (problem, etiology, and signs and systems)
- Critical thinking skills such as finding patterns and relationships, stating problems clearly and singularly, and ruling in/ruling out certain diagnoses are essential to making accurate nutrition diagnosis
- Accurate nutrition diagnoses set the stage for quality nutrition intervention and nutrition monitoring and evaluating
Nutrition Care Process Step 3 – Nutrition Intervention

- First and foremost is the need to prioritize the nutrition diagnoses
- Ideal goals and expected outcomes need to be identified prior to implementing nutrition interventions
- Interventions are derived from accurate diagnoses and largely driven by client involvement
- ADA’s evidence based guidelines for practice provides dietetics practitioners with tools that promote quality service and demonstrate effectiveness of care

Nutrition Care Process Step 4 – Nutrition Monitoring and Evaluating

- This step requires an active commitment to measuring and recording changes in the client’s condition as they relate to the nutrition diagnosis signs and symptoms
- Progress should be monitored, measured, and evaluated on a planned schedule
- Direct nutrition outcomes, clinical and health status outcomes, patient/client-centered outcomes, and healthcare utilization outcome are the types of outcomes to be measured
- Data from this step can be used to create outcomes management systems and can contribute to the body of evidenced-based research
Documentation of the Nutrition Care Process

Purpose of Medical Record Charting

- Legal documentation of medical care that the client has received
- Communication between members of the health care team
- Evaluation of medical care for that client
- Funding and resource management
- Continuous quality improvement
- Third-party reimbursement
- Accreditation
- Research

“Do Not Use” List

<table>
<thead>
<tr>
<th>Do Not Use</th>
<th>Potential Problem</th>
<th>Use Instead</th>

Table 6.4 Objective Section of SOAP Note

A. Age, ethnicity, gender, height/weight, BMI; any anthropometric measurement in addition to height and weight
B. Biochemical lab results that are of nutritional relevance
C. Clinical diagnosis, medication, treatment orders (including diet orders), any additional clinical findings of nutritional relevance
D. Dietary information, including current intake that has been observed (not subjective) or analysis of diet quality; protein/kcalorie requirements
### Table 6.5 Assessment Section of SOAP Note

1. Current nutrition Problems, Etiology, and Signs/symptoms (PES)
2. Potential nutritional problems (due to prognosis or clinical course of the disease, noncompliance and/or drug nutrient interactions)
3. Prioritization of the nutrition diagnoses

### Table 6.6 Plan Section of SOAP Note

<table>
<thead>
<tr>
<th>Gather</th>
<th>Additional information you need or would like (for current and potential nutritional problems; for instance, whether the patient is lactose intolerant)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referral</td>
<td>Referral to other health or social professional (examples: psychologist for an eating disorder or depression; social worker if patient is homeless)</td>
</tr>
<tr>
<td>Nutrition</td>
<td>Specific nutritional recommendations for the client/patient to address current nutritional problem(s) (these may be different than those stated under Assessment; for example, fewer kcalories to help achieve weight loss)</td>
</tr>
</tbody>
</table>
| Goals/Education | 1. What is/are your short-term goal(s) for this client/patient?  
2. For each goal, state the expected outcome(s) of dietary compliance as behavioral objectives for change, or expected outcome of the nutrition support. (Remember that outcomes should be measurable; specify a time frame and criterion [by how much], and encourage client participation, if possible.)  
   - Nutrition support to be recommended (when it is a medical procedure).  
   - Visuals, models, printed material to be given or used, if appropriate.  
   **Example:**  
   (Goal) Patient will increase dietary fiber consumption.  
   • Patient will eat whole-grain bread instead of white bread and increase consumption by one additional fruit and vegetable every day.  
   • Patient will be given a handout on whole-grain products. |
| Evaluation | Timeline and measures for nutrition monitoring and evaluation (When and how will you evaluate the outcome of your nutrition plan goals?) |
ADIME

- Assessment, Diagnosis, Intervention, Monitoring/Evaluation (ADIM)
- Reflects nutrition care process
- D sections is where PES statements are listed

IER

- Simplified SOAP
- Intervention, Evaluation, Revision of Care

**TABLE 6.8**

Sample IER Note

12/27/05 11:30 a.m. Nutrition Progress Note

**Intervention:**

Modify oral intake to 6-8 small feedings; increased nutrient density; addition of high-calorie, high-protein supplement; modification of texture; pain medication prior to meals and supplements.

---

**Evaluation**

Per calorie counts and patient visitation, oral intake improved, currently meeting 65% of estimated energy and protein requirements. No further weight loss documented since admission.

---

**Revision**

Check prealbumin to monitor visceral protein status.
FOCUS NOTES

**M. Nahikian-Nelms, PhD,-RD,-LD**
Calculations to Use

Anthropometrics

Measurement of body size frequently used to gain a general idea of nutritional status
Used to identify those people whose growth is outside normal values suggesting under or over nutrition
Screening tool to identify individuals at high risk of malnutrition
Use to monitor effects of nutritional intervention for treatment of disease, surgery, or malnutrition

Frame Size
Wrist circumference: measure wrist in cm
Calculate \( r = \frac{\text{Ht (cm)}}{\text{circumference (cm)}} \)

<table>
<thead>
<tr>
<th></th>
<th>Small</th>
<th>Medium</th>
<th>Large</th>
</tr>
</thead>
<tbody>
<tr>
<td>Men</td>
<td>&gt;10.4</td>
<td>10.4-9.6</td>
<td>&lt;9.6</td>
</tr>
<tr>
<td>Women</td>
<td>&gt;11</td>
<td>10.1-11.0</td>
<td>&lt;10.1</td>
</tr>
</tbody>
</table>

Midarm Circumference (MAC)
Measure arm in cm three times. Record the average and convert to mm (cm x 10 = mm)

Triceps Skin Fold (TSF)
Measure fold in mm three times. Record the average

Subscapular Skin Fold (SSF)
Measure fold in mm three times. Record the average

Midarm Muscle Area (MAMA)
Use MAC and TSF to calculate

\[
\frac{[\text{MAC in mm} - (3.14 \times \text{TSF in mm})]^2}{12.56} = \text{MAMA in mm}^2
\]
Divide MAMA by 100 to convert mm\(^2\) to cm\(^2\)
Subtract adjust factor (10 cm² male; 6.5 cm² female)

Determine MAMA Percentile

**Waist Circumference**
Measure at the natural waistline, which is normally, the narrowest part of the trunk and above the umbilicus. Measure with the tape snug but not tight.

<table>
<thead>
<tr>
<th>Low risk</th>
<th>Men &lt;90 cm</th>
<th>Women &lt;80 cm</th>

**Height/Weight**
Measure client in stocking feet and minimal clothing
Record both in U.S. and metric measures
Inch x 2.54 = cm   cm/100 = M   pound/2.2 = kg

**Weight Percentile**
Determine Wt. percentile using chart (15-50% considered average)

**IBW**
Hamwi Formula
Men: 106# for the first 5ft and an additional 6# for each inch >60”
Women: 100# for the first 5ft and an additional 5# for each inch >60”
Adjust for frame size if: small (subtract 10%) or large (add 10%)
**IBW %**
Current wt / IBW x 100

**UBW %**
Current wt / usual body wt x 100

**Body Mass Index**
Weight (kg) / Height $^2$ (m)
Weight (lb) / Height $^2$ (in) x 703.5

**Normal Ranges of Percent Fat**

### Table 3.12 Estimation of Energy Requirements

#### Harris-Benedict Equation

REE for females: \(655.1 + 9.6 \times W + 1.9 \times H - 4.7 \times A\)

REE for males: \(66.5 + 13.8 \times W + 5.0 \times H - 6.8 \times A\)

\([W = \text{weight in kg}; \ H = \text{height in cm}; \ A = \text{age in years}]\)

#### Mifflin-St. Jeor Equation

REE for females: \(10 \times W + 6.25 \times H - 5 \times \text{Age} - 161\)

REE for males: \(10 \times W + 6.25 \times H - 5 \times \text{Age} + 5\)

\([W = \text{weight in kg}; \ H = \text{height in cm}; \ A = \text{age in years}]\)

#### American College of Chest Physicians Equation

REE = \(25 \times \text{weight (kg)}\)

\([\text{if BMI} = 16–25, \text{use usual body weight}; \text{if BMI} > 25, \text{use ideal body weight}; \text{and if BMI} < 16, \text{use existing body weight for first 7–10 days, then use ideal body weight.}]\)

#### Penn State 2003 Equation

REE = \((0.85 \times \text{value from Harris-Benedict equation}) + (175 \times T_{\text{max}}) + (33 \times V_s) - 6443\)

\([V_s = \text{minute volume (in L/min)}; \ T_{\text{max}} = \text{maximum body temp in previous 24 hours}]\)

#### Ireton-Jones 1997 Equation

REE = \((5 \times \text{weight}) - (11 \times \text{age}) + (244 \text{ if male}) + (239 \text{ if trauma present}) + (840 \text{ if burns present}) + 1784\)

\([W = \text{weight in kg}; \ H = \text{height in cm}; \ A = \text{age in years}]\)

#### Swinamer 1990 Equation

REE = \((945 \times \text{body surface area}) - (6.4 \times \text{age}) + (108 \times \text{temperature}) + (24.2 \times \text{respiratory rate}) + (817 \times V_T) - 4349\)

\([V_T = \text{tidal volume in liters}]\)

#### FAO/WHO Basal Energy Estimation Equations

</tbody>
</table>

**Food Category**

**Meats**

- Recommended amount per day: 5 oz (equal in size to 2 decks of playing cards).
- Base your estimate on the food you consume most often.
- Beef and lamb selections are trimmed to 1/8" fat.

**Group 1.** 10 g or more total fat in 3 oz cooked portion

- **Beef**—Ground beef, Ribs, Steak (T-bone, Flank, Porterhouse, Tenderloin), Chuck blade roast, Brisket, Meatloaf (w/ground beef), Corned beef
- **Processed meats**—1/4 lb burger or lg. sandwich, Bacon, Lunch meat, Sausage/knackwurst, Hot dogs, Ham (bone-end), Ground turkey
- **Other meats, Poultry, Seafood**—Pork chops (center loin), Pork roast (Blade, Boston, Sirloin), Pork spareribs, Ground pork, Lamb chops, Lamb (rib), Organ meats*, Chicken w/skin, Eel, Mackerel, Pompano

**Group 2.** Less than 10 g total fat in 3 oz cooked portion

- **Lean beef**—Round steak (Eye of round, Top round), Sirloin**, Tip & bottom round**, Chuck arm pot roast**, Top Loin**
- **Low-fat processed meats**—Low-fat lunch meat, Canadian bacon, "Lean" fast food sandwich, Boneless ham
- **Other meats, Poultry, Seafood**—Chicken, Turkey (w/o skin)*, most Seafood*, Lamb leg Shank, Pork tenderloin, Sirloin top loin, Veal cutlets, Sirloin, Shoulder, Ground veal, Venison, Veal chops and rib*, Lamb (whole leg, fore-shank, sirloin)**

**Eggs**—Weekly consumption is the number of times you eat eggs each week

**Group 1.** Whole eggs, Yolks

**Group 2.** Egg whites, Egg substitutes (1/2 cups)

**Dairy**

- **Milk**—Average serving 1 cup
  - **Group 1.** Whole milk, 2% milk, 2% buttermilk, Yogurt (whole milk)
  - **Group 2.** Fat-free milk, 1% milk, Fat-free buttermilk, Yogurt (Fat-free, 1% low fat)

- **Cheese**—Average serving 1 oz
  - **Group 1.** Cream cheese, Cheddar, Monterey Jack, Colby, Swiss, American processed, Blue cheese, Regular cottage cheese (1/2 cup), and Ricotta (1/4 cup)
  - **Group 2.** Low-fat & fat-free cheeses, Fat-free milk mozzarella, String cheese, Low-fat, Fat-free milk & Fat-free cottage cheese (1/2 cup) and Ricotta (1/4 cup)

- **Frozen Desserts**—Average serving 1/2 cup
  - **Group 1.** Ice cream, Milk shakes
  - **Group 2.** Low-fat ice cream, Frozen yogurt

</table>

#### Table Fats – Average serving: 1 Tbsp

<table>
<thead>
<tr>
<th>Group 1. Butter, Stick margarine, Regular salad dressing, Mayonnaise, Sour cream (2 Tbsp)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group 2. Diet and tub margarine, Low-fat &amp; fat-free salad dressing, Low-fat &amp; fat-free mayonnaise</td>
</tr>
</tbody>
</table>

#### Snacks

<table>
<thead>
<tr>
<th>Group 1. Chips (potato, corn, taco), Cheese puffs, Snack mix, Nuts (1 oz), Regular crackers (1/2 oz), Candy (milk chocolate, caramel, coconut) (about 1 1/2 oz), Regular popcorn (3 cups)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group 2. Pretzels, Fat-free chips (1 oz), Low-fat crackers (1/2 oz), Fruit, Fruit rolls, Licorice, Hard candy (1 med piece), Bread sticks (1–2 pcs), Air-popped of low-fat popcorn (3 cups)</td>
</tr>
</tbody>
</table>

1. Organ meats, shrimp, abalone, and squid are low in fat, but high in cholesterol.
2. Only lean cuts with all visible fat trimmed. If not trimmed of all visible fat, score as if in Group 1.
3. Score 6 pts if this box is checked.
4. All parts not listed in Group 1 have <10 g total fat.

To Score: For each food category, multiply points in weekly consumption box by points in serving size box and record total in score column. If Group 2 foods checked, no points are scored (except for Group 2 meats, large serving = 6 pts).

Example: 3 pts 7 pts 1 pt 2 pts 3 pts 21 pts

Add score on page 1 and page 2 to get final score.

Key:
- ≥70 Need to make some dietary changes
- 40–70 Heart-Healthy Diet
- <40 TLC Diet

Total from page 1

**Step 3**
Acute disease effect score

If patient is acutely ill and there has been or is likely to be non-nutritional intake for >5 days

Score 2

**Step 4**
Overall risk of malnutrition

Add Scores together to calculate overall risk of malnutrition

Score 0 Low Risk  Score 1 Medium Risk  Score 2 or more High Risk

**Step 5**
Management guidelines

0 Low Risk
Routine clinical care
- Repeat screening
  - Hospital–weekly Care Homes–monthly
  - Community–annually for special groups e.g. those >75 yrs

1 Medium Risk
Observe
- Document dietary intake for 3 days if subject in hospital or care home
- If improved or adequate intake–little clinical concern; if no improvement–clinical concern follow local policy
- Repeat screening
  - Hospital–weekly Care Home–at least monthly
  - Community–at least every 2-3 months

2 or more High Risk
Treat
- Refer to dietitian, Nutritional Support Team or implement local policy
- Improve and increase overall nutritional intake
- Monitor and review care plan
  - Hospital–weekly
  - Care Home–monthly
  - Community–monthly
- Unless detrimental or no benefit is expected from nutritional support e.g. imminent death.

All risk categories:
- Treat underlying condition and provide help and advice on food choices, eating and drinking when necessary.
- Record malnutrition risk category.
- Record need for special diets and follow local policy.

Obesity:
- Record presence of obesity. For those with underlying conditions, these are generally controlled before the treatment of obesity.

Re-assess subjects identified at risk as they move through care settings

See The ‘MUST’ Explanatory Booklet for further details and The ‘MUST’ Report for supporting evidence.

<td>560</td>
<td>Provides energy, free water, sodium, and chloride</td>
</tr>
</tbody>
</table>
**ENTERAL NUTRITION**

- Provision of nutrients into the GI tract through tube or catheter when oral intake is inadequate.
- Considered when patient cannot or will not eat has a functional GI tract, and safe access.
- If the gut works, use it!
- Conditions that often require enteral nutrition:
  - Impaired nutrient ingestion
  - Inability to consume adequate nutrition orally
  - Impaired digestion, absorption. Metabolism
  - Severe wasting or depressed growth

**Access**

- **Nasogastric route:**
  - Short term (up to 3 or 4 weeks)
  - Non-surgical
  - Normal GI function
  - Bolus, intermittent or continuous infusions

- **Nasoduodenal or nasojejunal route:**
  - Short term (up to 3 or 4 weeks)
  - Non-surgical
  - Used with gastric motility disorders, aspiration, or persistent nausea and vomiting, gastric ileus

- **Surgically placed OSTOMY:**
  - Gastrostomies or jejunostomies
  - Long-term (> 4 weeks)

- **Percutaneous endoscopic gastrostomy (PEG) or percutaneous jejunostomy (PEJ):**
  - Longer than 3 to 4 weeks
  - Non-surgical

- **Multiple lumen tubes:**
  - Long term (> 4 weeks)
  - Used with prolonged GI decompression and small bowel feeding
Administration

- Continuous drip:
  - Infusion via pump/gravity
  - Used in small intestine feedings
  - Used to prevent GI stress
  - Minimizes risk of aspiration
  - Hourly rate determined by dividing the total volume of formula but the total number of feedings hours desired

- Bolus
  - Up to 250-500 mL rapid delivery via syringe 3 or 4 times daily (15 minutes)
  - No pump
  - Gastric feedings only
  - Total volume of formula is divided into number of feedings desired

- Intermittent:
  - Start with 100 to 150 mL and increase as tolerated, 20 to 60 minutes, several times per day via gravity drip or syringe

Formula

- Selection is based on:
  - Functional status of GI tract
  - Physical characteristics of formula
  - Energy and nutrient content
  - Digestion and absorption capability of patient
  - Clinical considerations
  - Cost effectiveness
  - Categories of formula:
    - Polymeric (whole protein and CHO)
    - Fiber containing (polymeric with fiber)
    - Monomeric (predigested nutrients, most low fat content, patients with minimal digestive and absorptive capacities)
    - Disease specific (e.g. respiratory, diabetes, renal failure, hepatic failure)
Composition of formula:
- Standard (lactose-free, concentrated)
- High-nitrogen (increased protein requirements i.e. burns, fistulas, trauma, sepsis)
- Protein (intact vs. hydrolyzed vs. pure amino acids; must provide 14 – 16% of calories)
- Carbohydrate (30 – 90% of kcals; lactose not used; addition of fiber)
- Lipid (1.5 – 55% of kcals, 2 – 4% as linoleic acid; fat does not influence osmolality, requires less CO2 production)
- Designer formulas (MCT for fat malabsorption; formulas with added n-3 fatty acids; structured lipids)
- Vitamins, minerals and electrolytes (based on DRI’s; expressed as mL to meet 100% DV’s on label)
- Fluid (1 mL/kcal standard; 60 – 85% water; can provide additional water via tube as needed)
- Modular formulas (single nutrient component; most common is protein)

Osmolality is a measure of which active particles per kg of solvent in which the particles are dispersed. Osmolality affects gastric retention, abdominal distention, diarrhea, nausea, and vomiting.
- Normal osmolality is 280-294 mOsm/kg
- Hypertonic: > this
- Hypotonic: < this
- Isotonic: Approx. 300 and up to 500 mOsm/kg

Example of Enteral Formula Calculation
- Pt calorie needs = 1500 kcal/day
- Protein needs: 58 g/day
- Fluid needs: Approx 1800 mL
- Formula: Novartis 1.07 kcal/mL, 43 g pro/L, 85% water
1500 kcal per day/1.07 kcal per mL = 1402 mL/24 hours = 58 mL/hr x 24 = 1392 mL per day
(1.392 L per day)

1392 mL x 1.07 kcal per mL = 1498 total kcal

Protein = 1.392 L x 43 g pro per L = 60 g protein per day

Fluids = 1392 mL x 0.85 water = 1183 mL water

1800 mL fluid needed – 1183 mL fluid used = 617 mL water wash = 205 mL every 8 hours (3 ww/d)
PARENTERAL NUTRITION

- Provision of nutrients directly into bloodstream intravenously
- Considered when feeding by an enteral route is not feasible or when the patient is hypermetabolic and it is not physically possible to meet total nutritional needs via enteral nutrition support
- If the gut works, use it!
- Conditions that often require parenteral nutrition:
  - Peritonitis
  - Short bowel syndrome
  - Uncontrollable diarrhea
  - Paralytic ileus
  - Chronic pancreatitis

Access

- Central parenteral nutrition (CPN):
  - Also known as total parenteral nutrition (TPN)
  - Catheter in large, central high blood-flow vein such as superior vena
  - Short term access: Peripherally inserted central catheters (PICC)
  - Long term access: tunneled catheters
  - Often provides total nutritional support
  - Can meet total nutritional requirements
  - Can provide 4000 kcal/day
  - Hypertonic solution
  - Starts out slow and is gradually increased to desired rate
- Peripheral Parenteral Nutrition (PPN):
  - Catheter in small vein, typically arm
  - Short term only (5-7 days or < 6 weeks)
  - Cannot tolerate concentrated solutions
  - Usually adjunct nutritional therapy (supplement to oral or enteral feedings)
  - Cannot meet total nutritional requirements
  - Can provide 1800 kcal/day
Isotonic or slightly hypertonic solution (< 900 mOsm/kg)

Administration of TPN

- Initiate 1 L first day; increase to goal volume on day 2
- Usually initiated at slow rate of 25 to 50 mL per hour
- Advanced every 12 or 24 hours
- Continuous:
  - Starting point for everyone
  - Increase incrementally over 2 or 3 days to reach goal rate
  - Avoid abrupt cessation
- Cyclic:
  - 8 to 12 hours per day, usually at night
  - Higher rate or more concentrated solution

Components of TPN

- Carbohydrate:
  - Dextrose monohydrate
  - Calories per gram = 3.4
  - Availability: 5, 10, 20, 25, 30, 40, 50 and up to 70%
  - Liver’s maximum rate of oxidation is 5 mg/kg/minute

Examples:

- 25% dextrose solution (D25) = 25 g dextrose/100 mL
- 800 mL of D30 has 240 g CHO and 816 kcals
  (800 x .30 = 240 g CHO; 240 g x 3.4 = 816 kcals)

Glucose rate of oxidation for a 70 kg male getting 200 g dextrose = 1.98 mg/kg/min
(200 g = 200,000 mg; 200,000 mg/70 kg = 2857.143/24 hrs a day = 119/60 min in an hr = 1.98 mg/kg/min)

- Amino acids:
  - Crystalline amino acids with or without electrolytes
  - 4 kcal/gram
  - Standard solutions: 3.5, 5.5, 8.5, 10, 15%
Examples:

3.5% AA = 3.5/100 mL or 35 g/100 mL

300 mL of AA10 has 30 g protein, 120 kcals, and 4.8 g nitrogen

(300 x .10 = 30 g protein; 30 g pro x 4 = 120 kcals; 30 g pro x .16 = 4.8 g nitrogen)

- Lipids:
  - Fat emulsions (composed of safflower oil, soybean oil, or a combo)
  - Major source of calories (4% should be linoleic acid)
  - Isotonic solutions
  - 10% = 1.1 kcal/min
  - 20% = 2.0 kcal/min
  - 30% 3.0 kcal/mL
  - Do not exceed 2.5 g/kg/day or 60% of nonprotein calories in adults

Examples:

500 mL of 10% lipids = 550 kcals (500 x 1.1 = 550)

250 mL of 20% lipids = 500 kcals (250 x 2.0 = 500)

- Vitamins/minerals:
  - Recommendations lower than RDA because digestion and absorption bypassed
  - Choice of salt forms for electrolytes: chloride (acidic) or acetate (basic)

**Components of PPN**

- Crystalline amino acids:
  - Don’t exceed 3-5% at final concentration

- Dextrose:
  - Don’t exceed 5 – 10% at final concentration

- Electrolytes/Vitamins/Minerals:
  - Based on intake from other sources (oral, tube, IV)

- Fat emulsions:
  - Based on kcal requirement
  - Don’t exceed 2.5 g fat per kg body weight per day
Transitional Feeding

- Parenteral to enteral:
  - Takes 2-3 days
  - Stop parenteral when enteral reaches 75%
- Parenteral to oral:
  - Stop parenteral when oral reaches 75%
- Enteral to oral:
  - Reduce enteral to night only to reestablish hunger/satiety cues
**GI SYSTEMS**

- **Upper**: Mouth, pharynx, esophagus, stomach
- **Lower**: Small and large intestine (includes ascending, transverse, descending, and sigmoid colon)
- **Accessory organs**: Liver, Biliary system, pancreas

**Needed for**

- **Motility**
  - Oral cavity, esophagus, stomach, intestines
- **Secretion**:
  - Gastric secretions of the stomach (gastric juice, mucous cells, chief cells, parietal cells, ECL cells), small intestine secretions (digestive enzymes, bicarbonate, bile)
- **Digestion**
  - Digestion in the stomach is mechanical and chemical; also occurs in large and small intestine
- **Absorption**:
  - Absorption occurs mostly in the small and absorption of water and some minerals in the large intestine

**Pathophysiology of the Upper GI Tract**

- **Oral Cavity**:
  - Oral disease:
    - Dental caries, stomatitis (inflammation of the mouth), glossitis (inflammation of the tongue), cheilosis (inflammation in corner of the mouth), xerostomia (dry mouth), dysgeusia (distorted taste), ageusia (no taste)
    - Intervention/treatment: Modification of distribution, type, or amount of foods; texture modifications

- **Esophagus**:
  - Gastroesophageal Reflux Disease (GERD):
    - Reflux of gastric contents into the esophagus due to incompetence of lower esophageal sphincter.
Symptoms: dysphagia (swallowing difficulty), heartburn, belching, aspiration, pain radiating to back, neck or jaw

Intervention/treatment: Reduction of gastric acidity, increase LES, medical management, modify lifestyle (smoking, physical activity, small frequent meals, weight loss if warranted), surgery

- Dysphagia:
  - Difficulty swallowing.
  - Symptoms: drooling, coughing, choking, weight loss, aspiration

- Achalasia:
  - Motility disorder with absence of peristalsis.
  - Elevated LES pressure.
  - Intervention/treatment: Texture modified diets, increased protein and caloric density, avoid extreme temperatures and spices, regular diet within 5-7 days.

- Hiatal Hernia:
  - Herniation of a portion of the stomach into the chest through the esophageal hiatus of the diaphragm.
  - Sliding: Most common. Gastroesophageal junction moves above the diaphragm together with some of the stomach.
  - Rolling: When a part of the stomach herniates through the esophageal hiatus and lies beside the esophagus.
  - Intervention: Surgery

- Stomach:
  - Dyspepsia (indigestion):
    - Symptoms: Bloating, belching, acidic taste
  - Nausea and Vomiting:
    - Caused by drugs, toxins, and metabolic conditions.
- Intervention/treatment: Medications or antiemetics to minimize symptoms and discomfort, maintenance of nutritional status

○ Gastritis:
  - Inflammation of gastric mucosa (stomach lining)
  - Type A: Autoimmune
  - Type B: H. pylori
  - Primary cause is H. pylori bacteria. Also can be from alcohol, food poisoning, NSAIDS
  - Symptoms: belching, anorexia, abdominal pain
  - Intervention/treatment: Antibiotics and medications

○ Peptic Ulcer Disease:
  - Ulcerations of the gastric mucosa that penetrate submucosa
  - Gastric or duodenal
  - Possible causes: H. pylori, NSAIDS, alcohol, smoking, genetic link
  - Symptoms: Epigastric pain, burning sensation, presence of blood in the stool or vomit
  - Intervention/treatment: Relieved with antacids, surgery, triple/quadruple therapy of medications, maintaining or improving nutritional status

○ Gastric Surgery:
  - Complications of PUD (hemorrhage, perforation, obstruction)
  - Billroth I (removes part of the stomach and top half of the stomach is reconnected to the duodenum) and Billroth II (removes part of the stomach and top half of the stomach is reconnected to the small bowel)
  - Roux-en-Y (aka gastric bypass. Through surgery a small stomach pouch is constructed and creates an outlet directly to the jejunum)
  - Dumping syndrome (food “dumps” into the small intestine) can occur. Early dumping = 10-20 min, intermediate = 20-30 min, late dumping = 1-3 hours
  - Intervention/treatment: Post gastrectomy or “anti-dumping” diet: includes initiating slow progression of solid food, pts may initially be lactose intolerant so dairy should be avoided, initially avoid all simple sugars.
Pathophysiology of the Lower GI Tract

- **Diarrhea:**
  - Increase in frequency of bowel movements or increase in water content of stools
  - >200 g/day adults, >20 g/day for children
  - Major complication is dehydration
  - Osmotic: increased water efflux due to an increase in osmolality; resolves when NPO
  - Secretory: underlying disease (bacteria, protozoa, viruses) causes secretions; does not resolve when NPO
  - Intervention/treatment: Treat underlying disease, antibiotics, NPO, low residue diet (BRAT), pro- and pre-biotics

- **Constipation:**
  - Decrease in frequency of bowel movements possibly due to IBS, rectal output obstruction, fecal impaction, adhesions, side effects of medications
  - Intervention/treatment: Increase whole grains, fruits, vegetables; 20-35 grams fiber per day; at least 2,000 mL fluid/day; pro- and pre-biotics

- **Malabsorption:**
  - Maldigestion of fat, carbs, and protein possibly due to decreased villous height, enzyme production, dysfunction of accessory organs due to disease
  - Steatorrhea: malabsorption of fat. Abdominal pain, cramping, diarrhea. Restrict fat 25-50 g/day, use of MCT supplements and pancreatic enzymes
  - Lactose Malabsorption. Increased gas, cramping, diarrhea. Restrict milk and dairy products, use products such as Lactaid
  - Protein Malabsorption: Protein-losing eteropathy due to destruction of GI tract, reduced serum protein.

- **Celiac Disease:**
  - Damage to the intestinal mucosa and villi due to exposure to gluten (in wheat, rye, barley, and malt).
  - Genetic and autoimmune
  - Infiltration of WBC, production of IgA antibodies
  - Can cause maldigestion and malabsorption
- Symptoms: Diarrhea, cramping, bloating, gas, abdominal pain, bone and joint pain, skin rash, mouth ulcerations
- Intervention/treatment: Gluten-free diet for life, low-residue to minimize diarrhea, low-fat (45-50g, lactose-free, identify all hidden sources of gluten

- Irritable Bowel Syndrome (IBS):
  - Functional disorder
  - Abdominal pain, alterations in bowel movements, gas
  - Aggravated by stress, anxiety, and depression. Increased serotonin, inflammatory response
  - Can lead to nutrient deficiency, malnutrition
  - Intervention/treatment: decrease anxiety, normalize dietary patterns, assess nutritional adequacy, adequate fluid, pre-and pro-biotics

- Inflammatory Bowel Disease (IBD):
  - Autoimmune, chronic inflammatory condition of the GI tract
  - 2 types: Ulcerative colitis (ulcerated colon, thinning of colon wall) and Crohn’s disease (thickening of colon wall, fistulas, obstruction, presents with skipping pattern throughout GI)
  - Symptoms: Bloody diarrhea, abdominal pain, C-reactive protein elevated, WBC elevated, weight loss
  - Intervention/treatment: antibiotics, immunosuppresants, surgery, enteral nutrition preferred over parenteral nutrition, supplement glutamine and arginine, may need to increase protein needs (1.5-1.75 g/kg), multivitamin, normalize dietary patterns, pro- and pre-biotics

- Diverticulitis/osis
  - -Itis: Abnormal presence of outpockets or pouches on surface of the small intestine or colon. Fever, abdominal pain, GI bleeding. Foodstuff and bacteria can collect and result in infection.
  - -Osis: Inflammation of these. Asymptomatic
  - Risks are low fiber intake, increased colonic pressure, obesity, steroids, alcohol and caffeine, cigarette smoking
- Intervention/treatment: -osis = high fiber diet + 6-10 grams, avoid nuts and seeds, fiber supplement. 
-itis: low-fiber diet, bowel rest, clear liquids, avoid nuts seeds and fibrous vegetables

**Surgical Interventions for the Lower GI Tract**

- Ileostomy: colon and rectum removed
- Colostomy: rectum removed
- Intervention: decrease risk of obstruction (avoid dried fruits, seeds, popcorn, drink adequate fluids), maintain fluid and electrolyte balance, reduce fecal output, minimize flatulence, multivitamin and B12 supplementation
CARDIOVASCULAR DISEASE (CVD)

Includes heart attack, stroke, angina, arrhythmias

Cardiovascular disease is the #1 killer in America

1 in 5 males and females has some form of CVD

Almost 150,000 Americans that are killed by CVD each year are under the age of 65

- Atherosclerosis:
  - A slow, progressive disease in which lesions are developed as a result of: injury to vessel wall (smoking, hypertension, oxidized LDL, diabetes) → proliferation of smooth muscle cells, macrophages, and lymphocytes → migration of smooth muscle cells into arterial walls, forming a matrix → accumulation of lipid, cholesterol, and other materials in matrix, making plaques.
  - Effect is high rigidity of blood vessel and low lumen size of blood vessels
  - Signs and symptoms: Typically a “silent killer” but with advancement = angina pectoris (precordial pain/pressure, high pulse, high BP) and acute myocardial infarction
  - Non modifiable risk factors: age, gender, family hx, race/ethnicity
  - Established, modifiable risk factors: high LDL, low HDL, high trigs, poor diet, physical inactivity, stress, hypertension, diabetes, obesity, metabolic syndrome, estrogen status

- LDL (“bad”) cholesterol is the primary blood lipid target for intervention efforts because it initiates and promotes atherogenesis.

  Aging, genetics, diet, obesity, diabetes, nephrotic syndrome can all increase LDL levels.

  Vitamin C, beta-carotene, reduced dietary saturated fat, trans fat, and cholesterol, increased fiber, plant sterols/stanols, and poly and mono unsaturated fats can decrease levels

- LDL Levels:
  - Desirable: < 100 mg/dL
  - Above desirable: 100-129 mg/dL
  - Borderline high: 130-159 mg/dL
  - High: 160-189 mg/dL
  - Very high: Greater than 190 mg/dL
• HDL (“good”) cholesterol can be increased by moderate fat diet, exercise, and loss of excess body fat, moderate consumption of alcohol. Obesity, inactivity, cigarette smoking, high trig levels, high saturated fat and sugar intake can decrease it
• HDL Levels:
  o Low: < 40 mg/dL (major risk for CVD)
  o Acceptable for men: > 40 mg/dL
  o Acceptable for women: > 50 mg/dL
  o High: > than 60 mg/dL (considered protective against heart disease)
• Factors that increase triglyceride levels:
  o Diet, estrogen, alcohol excess, obesity, untreated diabetes, hypothyroidism, liver disease. Factors that can decrease trigs are poly and monounsaturated fats, weight loss, smoking cessation, and limited simple sugars.
• Triglyceride Levels:
  o Desirable: < 150 mg/dL
  o Borderline high: 150-199 mg/dL
  o High: 200-499 mg/dL
  o Very high: > 500 mg/dL
• TLC Diet guidelines:
  o Saturated fat: < 7% total calories
  o Polyunsaturated fat: Up to 10% total calories
  o Monounsaturated fat: Up to 20% total calories
  o Total fat: 25-35%
  o Carbs: 50-60%
  o Fiber: 20-30 grams/day
  o Protein: Approx. 15% total calories
  o Cholesterol: < 200 mg/day
  o Plant sterols/stanols 3-4 g/day
  o Dietary soluble fiber: 8-10 g/day
• Metabolic Syndrome:
  o Aggregation of risk factors related to insulin resistance.
- Any 3 factors: waist circumference >35 in women and >40 in men; low HDL-c; high blood pressure (>130/85); TG >150; glucose >100.
- Exercise, weight control, high unsaturated fat diet

- Hypertension (chronic high blood pressure)
  - 20 mmHg increased in SBP = 60% higher mortality from CVD
- Blood Pressure Levels
  - Normal: SBP >120  DBP <80
  - Prehypertension: SBP 120-139  DBP 80-89
  - Stage 1 HTN: SBP 140-159  DBP: 90-99
  - Stage 2 HTN: ≥160  DBP ≥100
  - To treat: weight reduction, DASH eating plan, physical activity, moderate alcohol consumption (men ≤2 drinks/day, women ≤1 drink/day)
- DASH Diet Guidelines based on a 2,000 kcal diet:
  - 7-8 servings grains and grain products
  - 4-5 servings veggies
  - 4-5 servings fruit
  - 2-3 servings low or non-fat dairy
  - 2 or less meats, poultry, fish
  - 4-5 per week nuts, seeds, and legumes
Diseases of the Liver, Gallbladder, and Pancreas

These diseases include Hepatic Diseases (Encephalopathy, Hepatitis, Cirrhosis, and Alcoholic Liver Disease), Cholelithiasis, and Pancreatitis.

Symptoms

- Encephalopathy- Begins with little awareness, small attention span, a sense of euphoria or depression or irritability, and being uncoordinated.
- Hepatitis- Jaundice, dark urine, anorexia, fatigue, headache, nausea, vomiting, and fever.
- Cirrhosis- Poor appetite, weakness, nausea, malaise, jaundice, dark urine, steatorrhea, itching, abdominal pain, and bloating.
- Alcoholic Liver Disease-Sometimes can be asymptomatic. Some symptoms can include anorexia, jaundice, dark urine, fever, and hepatomegaly.
- Cholelithiasis- Fever, diarrhea, vomiting, nausea, tenderness/pain in the upper right quadrant of the stomach.
- Pancreatitis- Can be asymptomatic. Some symptoms may include upper abdominal pain, steatorrhea, and Type II DM (chronic only).

Significant Labs/Clinical signs:

- Encephalopathy- Elevated serum ammonia levels, asterixis, neurological signs (unawareness, depression, etc).
- Hepatitis- Elevated bilirubin, alkaline phosphatase, and serum AST levels are common.
- Cirrhosis- The CTP and MELD tests are used as well as bilirubin and creatinine.
- Alcoholic Liver Disease- GGT, AST, and ALT are commonly elevated in patients with ALD.
- Cholelithiasis- No specific lab values associated with diagnosis. Diagnosed based on the symptoms.
- Pancreatitis- Elevated serum lipase and amylase levels are common. Ranson and Apache II tests are also used to help diagnose pancreatitis and its severity. Also diagnosed based mainly on symptoms.

Nutritional Management:
• **Encephalopathy** - The main problem with this disease is high ammonia levels, in order to lower ammonia levels, protein is restricted. Plant sources are recommended for protein consumption as well as dairy products; fiber is also increased.

• **Hepatitis** - People with hepatitis often have problems with inadequate intake, food-medication interactions, and impaired nutrient utilization. The goal of nutrition intervention is to prevent further cell damage and provide adequate nutrients for regeneration. This is done through small frequent meals often with calorie dense foods and supplements like Ensure. Alcohol is the only restriction.

• **Cirrhosis** - Malnutrition and vitamin/mineral deficiencies are common due to inadequate energy, protein, and vitamin/mineral intake. Recommended intake for energy is 35-40g/kg body weight. Recommended intake for protein is 1.6g/kg body weight; protein should also come from mostly plant and dairy sources. If the patient has signs of steatorrhea, they should be limited to less than 30% of kcal from fat.

• **Alcoholic Liver Disease** - Some nutrition problems include inadequate energy, protein, and vitamin/mineral intake; malnutrition; altered GI function; and involuntary weight loss. These are due to anorexia and intake of alcohol instead of food/nutrients. MNT for this disease is to provide adequate nutrients for regeneration of tissue. Treatment includes rest and adequate fluid intake. Patients are encouraged to consume 30-35kcal/kg body weight of energy, 1.5-2g/kg body weight of protein, and high complex CHO at 6-8g/kg body weights.

• **Cholelithiasis** - For acute cholelithiasis, NPO and bowel rest is recommended. Parenteral nutrition is used with lowered amounts of fat. Slowly progress back to a normal diet. For chronic cholelithiasis, lowered fat diet is recommended (25%) as well as gradual weight reduction and a diet higher in complex CHO and fiber. Water-soluble forms of fat-soluble vitamins may be necessary if there is fat malabsorption.

• **Pancreatitis** - For acute pancreatitis, NPO is recommended at first; new evidence now suggests that beginning re-feeding as soon as possible results in shorter hospital stays. They also no longer recommend starting with clear liquids and instead immediately starting oral intake. For chronic pancreatitis, the goal is to treat steatorrhea, correct malnutrition, and prevent weight loss. Frequent small meals with moderate to low fat can help reduce frequency of attacks. Fat should be as high as the patient can tolerate without
steatorrhea and/or pain. In addition, pancreatic enzymes may be given in order to help with digestion and absorption. Water-soluble forms of fat-soluble vitamins may be necessary if there is fat malabsorption.
RENAL DISEASE

Acute Renal Failure: Occurs when the kidneys suddenly stop functioning due to abrupt cessation or reduction in GFR

Symptoms
- Accumulation of nitrogenous waste
- Rapid declining status, loss in lean body mass, toxicity related symptoms
- Elevated BUN and Creatinine
- Prerenal azotemia
- Exposure to toxins
- Glomerulonephritis
- Sjojren’s syndrome
- Kidney stone
- Blood clots
- Tumor

Significant Labs/Clinical signs
- Potassium
- Magnesium
- Phosphorus
- BUN must be kept between 80-100 mg/dl

Nutritional Management
- Protein: 0.6-0.75 g/kg
- If not dialyzed, GFR < 25 ml/min
- Calories: 30-40 kcal/kg
- Sodium: 2 grams
- Fluids: Restrict only in patients with oliguria
- Provide calcium, folate and B6 supplements

Chronic Kidney Disease: Syndrome in which progressive loss of kidney function occurs. Irreversible

Symptoms
- Stages 1 & 2 – kidney damage with normal or increased GFR, mild decrease in GFR
• Stage 3 - Moderate decrease: GFR 30-59 mL/min
• Stage 4 - Severe decrease: GFR 15-29 mL/min
• Stage 5 (ESRD) - Inadequate to sustain life
  o GFR < 15 mL/min
  o Uremia, hyperphosphatemia, azotemia, oliguria
  o Sodium retention, edema, HTN
  o Metabolic acidosis
  o Hyperkalemia
  o Microcytic anemia and iron deficiency
  o Renal osteodystrophy

Significant Labs/Clinical signs
• BUN
• Creatinine
• Potassium
• PO4
• Uric acid
• Magnesium
• Blood Pressure
• Calcium
• H&H
• Ferritin
• GFR

Nutritional Management
• Predialysis: Stages 3&4
  o Maintain positive nitrogen balance
  o Protein restriction
  o GFR<25ml/min : 0.6-0.75 g/kg per day, >50% HBV
  o Calories: 35 kcal/kg per day and 30 kcal/kg for >60 years of age
  o Phosphorus: 800-1000 mg/day
  o Sodium:1-3 gm/kg (Higher restriction with edema)
• **Hemodialysis: Stage 5**
  o High in protein - 1-1.2 g/kg
  o Control intake of potassium, phosphorus
  o Sodium - 2-3 g
  o Possible modifications in fat, cholesterol, TG
  o Fluid - 1000 ml/day + urine output

• **Peritoneal Dialysis: Stage 5**
  o High in protein - 1.2-1.3 g/kg (higher if peritonitis)
  o High potassium
  o Sodium - 6-8 g
  o Limit phosphorus
  o Energy needs slightly higher but is individualized
  o Account for calories in dialysate
  o Fluid - minimum 2000ml/day + urine output

*All: No added table salt. Try to quench thirst without drinking water (chewing on ice, eating cold fruit)*

**Nephrotic Syndrome:** Heterogeneous group of diseases - loss of glomerular barrier to protein

**Symptoms**

- Proteinuria
- Hematuria

**Significant Labs/Clinical signs**

- Nitrogen Balance
- Albumin
- Pre-albumin
- Calcium
- Sodium
- Phosphorus
- Potassium

**Nutritional Management**

- Protein: replace losses from urine
- Sodium: 2-3 g/day
• Energy: 35 kcal/kg BW/day
• Cholesterol lowering diet and drugs
**DIABETES**

**Type 1:** Characterized as an absolute deficiency of insulin due to destruction on pancreatic beta cells, resulting in the inability of cells to use glucose for energy.

**Symptoms**
- Polydipsia
- Polyuria
- Polyphagia

**Significant Labs/Clinical signs**
- Potassium
- Sodium
- Magnesium
- Phosphorus
- Serum osmolality
- Hemoglobin and Hematocrit
- Protein
- WBC count
- Creatinine
- Plasma glucose (both fasting and non-fasting)

**Nutritional Management**
- Total fat, saturated fat, cholesterol, fiber, vitamins and minerals are the same for every individual, whether diabetes is present or not
- Protein – 15-20% of daily kcals from protein and animal sources
  - % PRO = grams protein x 4 / total kcals
- Carbohydrates – 130 grams/day
  - % CHO = grams carbs x 4 / total kcals
- % FAT = grams fat x 9 / total kcals
- Increase physical activity

**Type 2:** Non-insulin dependent.

**Symptoms**
- Nausea/vomiting
• Stomach pain
• Fruity or acetone breath
• Kussmaul respirations
• Mental status changes

**Significant Labs/Clinical signs**

• OGTT
• IGT
• IFG
• Blood glucose levels
• Fasting plasma glucose
• A1C

**Nutritional Management**

• Total fat, saturated fat, cholesterol, fiber, vitamins and minerals are the same for every individual, whether diabetes is present or not
• Protein – 15-20% of daily kcals from protein and animal sources
  o % PRO = grams protein x 4 / total kcals
• Carbohydrates – 130 grams/day
  o % CHO = grams carbs x 4 / total kcals
• % FAT = grams fat x 9 / total kcals
• Increase physical activity
**Diseases of the Respiratory System:**

These diseases include Asthma, BPD (bronchial pulmonary dysplasia), COPD, Cystic Fibrosis, Respiratory Failure, and Transplantation. Cystic Fibrosis (CF)-Affects the lungs, liver, pancreas, GI, reproductive system, and skin. Treatments are focused mainly on lungs, pancreas, and GI.

**Symptoms**

- **Asthma**- Coughing, wheezing, dyspnea, and tightness of the chest.
- **BPD**- This is found primarily in premature infants (<32 weeks gestational age).
- **COPD**- Decreased airflow rates, dyspnea, hypoxemia, and hypercapnia (bronchitis). Dyspnea, orthopnea, hypercapnia, respiratory acidosis, extreme fatigue, and exhaustion (emphysema).
- **CF**- Most people are diagnosed by age three. Pulmonary symptoms include chronic cough and wheezing due to mucus. Pancreatic/GI- Steatorrhea, abdominal distention, and poor growth pattern despite normal appetite.
- **Respiratory Failure**- History of diseases such as COPD, CF, ALI, or ARDS.
- **Transplantation**- Only those that are significant of needing transplantation such as RF, CF, or severe COPD.

**Significant Labs/Clinical signs**

- **Asthma**- Diagnosed by symptoms and restriction of airways.
- **BPD**- Serum vitamin A levels may be low, but this is often diagnosed around the time the baby is born, since this effects premature babies.
- **COPD**- Diagnosed based on symptoms.
- **CF**- Sweat chloride test, blood test (to check for the CFTR gene), sputum cultures, pancreatic function tests, and pulmonary function tests.
- **Respiratory Failure**- Diagnosed based on history (COPD, CF) and symptoms.
- **Transplantation**- None.

**Nutritional Management**

- **Asthma**- Asthma generally increases with obesity rates, thus a primary measure would be to prevent obesity rates with a healthy balanced diet and exercise. Leukotrienes in the body contribute to the development of asthma, thus a diet with inhibitors to leukotrienes
is recommended. Leukotrienes are synthesized from Omega 6 FAs, thus Omega 3 FAs should be increased to interfere with the metabolism of Omega 6’s. Antioxidants, specifically vitamin C is also recommended for the same reason.

- **BPD**- Breast milk or high-energy formulas are recommended. Supplementation with vitamin A and antioxidants is also recommended since low vitamin A levels and antioxidant damage may be related to the cause. A nasogastric feeding tube may be necessary. 15-20% higher energy needs may be necessary; energy-120-130 kcal/kg/day or higher and Protein 3-4 g/kg/day.

- **COPD**- Maintaining optimal energy balance to stay lean and healthy is important. 125-156% energy above BEE and 1.2-1.7 g/kg body weight of protein. Commercial formulas that are lower in CHO (30%) and higher in fat (50%) may be recommended.

- **CF**- Nutrition treatment is focused mainly on the pancreatic area of CF. Malabsorption of fats, malnutrition, and underweight are the most common nutrition diagnoses. The most common intervention is supplementation of pancreatic enzymes. Increased energy intake of (110%-200% of the RDA) may be necessary in cases of malabsorption. Increased fat intake (35-40%) is also recommended to compensate for fat malabsorption. For the same reason, fat-soluble vitamins may also need to be supplemented. Excess sodium may also be necessary, because much salt is lost in the sweat.

- **Respiratory Failure**- Meet nutrition needs. Enteral and/or parenteral nutrition support may be necessary. Vitamin and mineral supplementation may be necessary.

- **Transplantation**- Make sure nutritional status is as optimal as possible prior to surgery since it may decline post surgery. Post surgery, provide adequate nutrients to promote healing (increased pro and kcal), treat changes in electrolyte balance, and regulate blood glucose. Enteral/parenteral nutrition may be necessary.
**Neoplastic Disease**

Carcinogenesis- a multistep process in which normal cells and transformed into cancer cells. This process may be enhanced with the help of carcinogens such as harmful chemicals, pollution, radiation, or infectious microorganism.

- Biomarkers are indicators that can be used to determine the amount or indicate the effects or progress of a disease or condition.

Cachexia is a condition that is common among cancer patients. Involuntary weight loss, tissue wasting, fatigue and metabolic alterations characterize it.

**Prevention**

- Primary Prevention- decrease the potential activity as a carcinogen such as promoting a healthier lifestyle
- Secondary Prevention- Early detection and screening

**Signs and Symptoms**

- Formation of a neoplasm
- Metastasis of a neoplasm
- Tumor markers are measured to check for tumor and indicate whether it has metastasized.
- CT scans
- PET Scans
- Mammogram

**Nutrition Intervention for Cancer and Cachexia**

- Enteral and parenteral nutrition support may not be beneficial to cancer patients because of the ongoing alteration of metabolism.
- The amount of calories needed can be determined by the Harris- Benedict equation, Mifflin St. Jeor, or by calculating needs based on body weight
  - Obese patients 21-25 kcalories/kg
  - Non ambulatory/sedentary adults 25-30 kcalories/kg
  - Slightly hypermetabolic patients, patients who need to gain weight, or anabolic patients 30-35 kcalories/ kg
  - Hypermetabolic patients, severely stressed patients, or patients experiencing malabsorption >35 kcalories/kg
The amount of protein that needs to be consumed

- Normal or maintenance 0.8-1.0 g/kg
- Non stressed cancer patients 1.0-1.5 g/kg
- Bone marrow transplant or HSCT patients 1.5 g/kg
- Wasting or hypermetabolism 1.5-2.5 g/kg
- Hepatic or Renal Compromise 0.5-0.8 g/kg
Metabolic Stress

Metabolic stress is a hypermetabolic, catabolic response to acute injury or disease.

Factors

- Trauma
- closed head injury
- burns
- severe inflammation
- cancer
- sepsis
- hypoxic injury
- necrosis of tissue
- major surgery

Nutrition Therapy

- The amount of calories needed can be determined by using the Harris- Benedict or Mifflin St. Jeor equations. Activity factors, injury factors, and protein requirements should also be calculated.
  - Activity Factors
    - Out of bed 1.2
    - Confined to bed 1.1
  - Average Injury Factors
    - Surgery 1.0 – 1.3
    - Infection 1.0- 1.4
    - Skeletal trauma 1.2 -1.4
    - Head injury 1.5
  - Protein Requirements
    - RDA 0.8 g/kg
    - Minor Surgery 1.0 -1.1g/kg
    - Major Surgery 1.2 -1.5 g/kg
    - Burns 1.5- 2.0 g/kg
• Oral nutrition is the preferred route for meeting nutritional needs. If the patient is critically ill then enteral or parenteral nutrition is administered.
• The amino acids glutamine and arginine should be considered when feeding hypermetabolically stressed patients.
• Burns
  o Using direct calorimetry, Harris-Benedict equation, or Mifflin St. Jeor assesses energy requirements.
  o An equation that is specific to burns that can also be used is the Curreri equations.
**HIV and AIDS**

- HIV stands for Human Immunodeficiency Virus. It is defined as a virus that targets host cells and turns them into viral factories for HIV production.
- Primary HIV infection - the time of the initial seronconversion to HIV infection; usually involves a spike in the level of the virus and sometimes accompanied by flu-like syndrome.
- AIDS stands for Acquired immunodeficiency syndrome. It is defined as the immune dysfunction characterized by the destruction of immune cells, leaving the body open to infection.
- The screening test is called ELISA (enzyme linked immunoabsorbant assay)
- Disease Progression is linked to CD4 t-cell count.
  - Category 1 ≥ 500 cells/µL
  - Category 2 200-499 cells/µL
  - Category 3 < 200 cells/µL
- AIDS related wasting syndrome (AWS) is categorized as weight loss less than 10% without any known cause followed by fever or diarrhea for more than one month. Anthropometric measurements should be taken to assess whether muscle mass is also lost during this syndrome.
  - Criteria for AWS
    - Weight Loss
      - 10% or more in a year
      - 7.5% loss over 6 months
    - BMI <20
    - Body Cell Mass
      - 5% loss over 6 months
      - <35% of weight if BMI is less than 27 in men
      - < 23% of weight if BMI is less than 27 in women
- Other Symptoms that could result in malnutrition
Barrett’s Esophagus- pre malignant condition that is considered a risk factor for esophageal adenocarcinoma. It is a complication of GERD that is characterized by changes in the cells of the tissue that line the bottom of the esophagus.

- Dumping Syndrome- this condition occurs when food moves too quickly from the stomach to the small intestine.
- Steatorrhea- malabsorption of fat that results in severe diarrhea.

- **Side Effects of Chemotherapy**
  - Neutropenia
  - Thrombocytopenia
  - Anemia
  - Diarrhea
  - Mucositis
  - Alopecia

- **Side Effects of Radiation Therapy**
  - Fatigue
  - Mucositis
  - Dysguesia
  - Xerostomia
  - Dysphagia
  - Odynophagia
**Clinical Lab Values**

<tr>
<td>Testosterone</td>
<td>350–1,000 ng/dL</td>
<td>Decreased in hypogonadism, AIDS wasting</td>
</tr>
<tr>
<td><strong>Cardiovascular</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total cholesterol</td>
<td>120–199 mg/dL</td>
<td>Elevated in hyperlipidemia, diabetes, obesity, infection</td>
</tr>
<tr>
<td>HDL</td>
<td>40–60 mg/dL</td>
<td>Decreased in starvation, obesity, diabetes, smoking, liver disease, AIDS</td>
</tr>
<tr>
<td>LDL</td>
<td>&lt;100 mg/dL</td>
<td>Elevated in hyperlipidemia, lower in advanced AIDS</td>
</tr>
<tr>
<td>Triglycerides</td>
<td>Fasting: &lt;150 mg/dL</td>
<td>Elevated in hyperlipidemia, AIDS</td>
</tr>
<tr>
<td>C-reactive protein (CRP)</td>
<td>Regular: &lt;0.8 mg/dL</td>
<td>High sensitivity CRP will provide risk as low (&lt;1 mg/L), average (1–3 mg/L), or high (&gt;3 mg/L)</td>
</tr>
<tr>
<td><strong>Electrolytes</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sodium</td>
<td>136–144 mEq/L</td>
<td>Decreased in diarrhea, vomiting, AIDS</td>
</tr>
<tr>
<td>Potassium</td>
<td>3.5–5.5 mEq/L</td>
<td>Decreased in diarrhea, vomiting, chronic stress, fever</td>
</tr>

**Nutritional Assessment**

<table>
<thead>
<tr>
<th>Nutrient</th>
<th>Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluids</td>
<td>Hydration maintenance is the goal, and standard fluid intake recommendations can apply; additional fluids are recommended in cases of dehydration, fluid losses through diarrhea or sweating; restrictions are recommended in cases renal insufficiency</td>
</tr>
<tr>
<td>Kcal</td>
<td>Weight maintenance is the goal with additional kcal typically recommended if weight gain is desired and a mild restriction in kcal to achieve desired weight losses; additional energy may be required during bouts of opportunistic conditions that increase metabolic rate; increased kcal requirements during pregnancy and lactation should be incorporated into recommendations</td>
</tr>
<tr>
<td>Carbohydrate</td>
<td>The amount and types of carbohydrate recommended are based on both energy needs and carbohydrate tolerance; insulin resistance and diabetes may require dietary modification to modulate glucose and insulin levels</td>
</tr>
<tr>
<td>Protein</td>
<td>The amount and types of protein recommended are based on the need for protein stores maintenance; additional protein is likely to be needed in cases of inflammation, fever, and during pregnancy; any protein losses should be restored with increased protein intake and activity to promote protein stores maintenance; renal disease or other conditions may require protein restriction or other changes in protein recommendations</td>
</tr>
<tr>
<td>Fat</td>
<td>The amount and types of fat recommended are based on energy needs, cardiovascular risk, and inflammatory conditions; weight maintenance may require increases or decreases in fat kcal; cardiovascular risk may require lower fat intake and a higher ratio of unsaturated fats; omega-3 fatty acid sources may be recommended to help reduce inflammation effects as well as improve lipid profiles</td>
</tr>
<tr>
<td>Vitamins and minerals</td>
<td>Recommendations are based on individual needs; for instance, during bouts of diarrhea, the replacement of electrolytes and any potential losses of vitamins and minerals (such as fat-soluble vitamins during steatorrhea and zinc during larger volume losses of fluids) are essential to balance; upper limits of toxicity, the potential for nutrient interactions with medications and disease, and balance in micronutrient intake should be considered in recommendations (for instance, iron supplementation is controversial due to the potential for increasing the risk of opportunistic infection without overcoming the inflammatory-mediated drop in iron availability), specific conditions that alter micronutrient requirements, such as pregnancy and lactation or child growth and development, should be considered in recommendations</td>
</tr>
<tr>
<td>Fiber</td>
<td>Fiber recommendations are similar to those in healthy individuals and fiber has been suggested to improve glucose tolerance, affect glycemic response to foods, and reduce the potential for cardiovascular risk and altered fat deposition seen in lipodystrophy</td>
</tr>
